

NTP8825

**High Performance, High Fidelity Power
Driver Integrated Full Digital Audio Amplifier**

**Datasheet
Draft ver. 0.4**

General Description

The NTP8825 is a single chip full digital audio amplifier including power stages for stereo amplifier systems. NTP8825 is integrated with versatile digital audio signal processing functions, high-performance, high-fidelity fully digital PWM modulator and two high-power full-bridge MOSFET power stages.

The NTP8825 receives digital serial audio data with sampling frequencies from 8kHz through 192kHz. It delivers 2 x 25 watts in the stereo mode with a heat sink.

The NTP8825 has a mixer and Bi-Quad filters which can be used to implement essential audio signal processing functions like compensation of a loud speaker response and parametric equalization.

All the functions of the NTP8825 can be controlled by internal register values via I²C host interface bus.

Features

- 2 CH Stereo (20W x 2 BTL @24V, 6Ω)
- 2.1CH (10W x 2 + 20W @24V, 6Ω)
- SDATA Generator (I²S output)
- Wide Operating Supply Voltage Range (7V to 28V)
- Floating Point Operation
- 25 Programmable Bi-Quad Filters
 - ✓ Speaker Compensation
 - ✓ LPF, HPF
 - ✓ Parametric Equalizer
 - ✓ Loudness Control
- 100dB Dynamic Range
- 2 Band Dynamic Range Control
- 5 Band Graphic Equalizer
 - ✓ 10 GEQs in User mode for LR
- 3D Surround
- Protection Circuit
 - ✓ OCP(Over Current Protection)
 - ✓ OTP(Over Temperature Protection)
 - ✓ UVP(Under Voltage Protection)
- High Efficiency
- Asynchronous Sample Rate Conversion
- DC cut filter

Package

(40 pin SAW QFN 6mm x 6mm Package)

Applications

- PDP TV or LCD TV
- Docking Station
- Mini-Component Audio Solution

2. PIN ASSIGNMENTS

Figure 2. NTP8825 Pin Assignments

3. PIN DESCRIPTIONS

PIN	NAME	TYPE	DESCRIPTION
1	VDD_PLL	P	Regulator output for PLL digital block, 1.2V
2	GND	P	This pin should be connected to Ground
3	SDATA	I	I ² S serial data input
4	WCK	I	I ² S word clock
5	BCK	I	I ² S bit clock
6	SDA	I/O	I ² C data
7	SCL	I	I ² C clock
8	DVDD	P	Regulator output for Core block, 1.2V
9	/FAULT	I	Active low to reset internal power stage, Pull-up
10	SW_STBY	O	External power device standby control
11	SW_A/ MONITOR_1	O	Sub-Woofer_A/Monitoring signal out from processor block
12	SW_B/ MONITOR_2	O	Sub-Woofer_B/Monitoring signal out from processor block
13	HP_L	O	Left audio channel Headphone signal
14	HP_R	O	Right audio channel Headphone signal
15	HP_MUTE	O	External Headphone mute signal
16	BST2B	P	Bootstrap supply, external capacitor to OUT2B is required
17	PGND2B	P	Ground
18	OUT2B	O	Power stage PWM output 2B
19	PVDD2B	P	Power supply for PWM Power stage 2B
20	PVDD2A	P	Power supply for PWM Power stage 2A
21	OUT2A	O	Power stage PWM output 2A
22	PGND2A	P	Ground
23	BST2A	P	Bootstrap supply, external capacitor to OUT2A is required
24	VDR2	P	Gate drive voltage regulator decoupling pin, capacitor to GND is required
25	AGND	P	Ground
26	VCC5	P	Logic voltage decoupling pin, capacitor to GND is required
27	VDR1	P	Gate drive voltage regulator decoupling pin, capacitor to GND is required
28	BST1B	P	Bootstrap supply, external capacitor to OUT1B is required
29	PGND1B	P	Ground
30	OUT1B	O	Power stage PWM output 1B
31	PVDD1B	P	Power supply for PWM Power stage 1B
32	PVDD1A	P	Power supply for PWM Power stage 1A
33	OUT1A	O	Power stage PWM output 1A
34	PGND1A	P	Ground
35	BST1A	P	Bootstrap supply, external capacitor to OUT1A is required
36	/RESET	I	Active low to reset NTP8825, Schmitt trigger input
37	AD	I	I ² C device address selection
38	CLK_I	I	System master clock input
39	CLK_OUT	O	System master clock output
40	VDD_IO	P	Power supply for digital interface I/O, 3.3V
-	Thermal Pad	P	This pad should be connected to Ground

P = Power Supply or Ground, I = Input, O = Output, I/O = Input / Output

Table 1. NTP8825 Pin Description

4. CHARACTERISTICS AND SPECIFICATIONS

4.1. Absolute Maximum Ratings

Parameter	Reference	Rating	Unit
DVDD voltage	DGND	-0.3 ~ 1.5	V
VDD_IO voltage	GND_IO	-0.3 ~ 5.25	V
Logic input voltage	GND	-0.3 ~ 5.25	V
Logic output voltage	GND	-0.3 ~ 5.25	V
PVDDXX voltage	PGNDXX	30	V
OUTXX voltage	PGNDXX	-0.3 ~ PVDDXX	V
BSTXX voltage	PGNDXX	36.0	V
VDRX voltage	PGNDXX	-0.3 ~ 6.0	V
Junction temperature	T _j	150	°C

4.2. Recommended Operating Conditions

Parameter	Reference	Min	Typ	Max	Unit
VDD_IO voltage	GND_IO	3.0	3.3	3.6	V
PVDDXX voltage	PGNDXX	7		28	V
VDRX voltage	PGNDXX		5.1		V
Ambient operating temperature	T _{AMB}	0		85	°C

4.3. DC Electrical Characteristics

Parameter	Symbol	Condition	Min	Typ	Max	Unit
Logic Block (VDD_IO=3.3V, T _A =+25°C, unless otherwise specified.)						
Input High voltage	V _{IH}	-	2.0			V
Input Low voltage	V _{IL}	-	-0.5		0.8	V
Schmitt trig. Low to High threshold point	V _{T+}	-	2		3.6	V
Schmitt trig. High to Low threshold point	V _{T-}	-	-0.5		0.8	V
Input current	I _I	V _{IN} =V _{IL} MAX, DVDD=MIN	-50			uA
		V _{IN} =V _{IH} MIN, DVDD=MIN			50	uA
Input leakage current	I _L	V _{IN} =VSS, DVDD=MIN	-10		10	uA
Output Low voltage	V _{OL}	I _{OL} = -4mA	0		0.4	V
Output High voltage	V _{OH}	I _{OH} = 4mA	2.4		3.6	V
LDO output voltage	V _{LDO}	DVDD	1.08		1.32	V
Power Driver Block (PVDDXX=20V, T _A =+25°C, unless otherwise specified.)						
Current consumption	I _{CC}	VDD_IO=3.3V, No Input, No Load		30		mA
	I _{PVDD}	PVDD=24V, No Input, 8 Ω Load with 10uH		95		
Peak current limit	OCP	-	5.0	6.5	9.0	A
Thermal shutdown temperature	OTP	-	140	150	160	°C
Under voltage protection limit	UVP	-	4.75	5.0		V

4.4. PLL Input Parameters and External Filter Components

Parameter	Min	Typ	Max	Unit
MCLK frequency range	2.048		49.152	MHz
MCLK duty cycle	20	50	80	%
Rise/fall time for MCLK			5	ns
MCLK square wave jitter			0.1	UI
External PLL filter capacitor C10		220		nF
External PLL filter capacitor C11		22		nF
External PLL filter resistor R13		220		Ω

4.5. Performance Specification

Parameter	Condition	Min	Typ	Max	Unit
SNR	AES17, A-weighting filter		95	100	dB
THD+N	1W, 1kHz		0.1		%
P _{OUT}	Peak output power		20		W
Cross talk			67		dB
Output noise voltage	P _{VDD} =24V		500		μ V
Efficiency	P _{VDD} =12V, P _{OUT} =15W @ 6 Ω , THD 1%		90		%
PWM frequency			384		KHz

CONFIDENTIAL

4.5. Switching Characteristics – I²C Control

Parameter	Symbol	Condition	Min	Max	Unit
I²C Control Port					
SCL clock frequency	F _{scl}		-	400	kHz
Hold time for START condition	T _{hdsta}		600	-	ns
Low period of the SCL clock	T _{low}		1300	-	ns
High period of the SCL clock	T _{high}		600	-	ns
Rise time of SDA and SCL signals	T _{rise}		-	300	ns
Fall time of SDA and SCL signals	T _{fall}		-	300	ns
Setup time for STOP condition	T _{susto}		600	-	ns

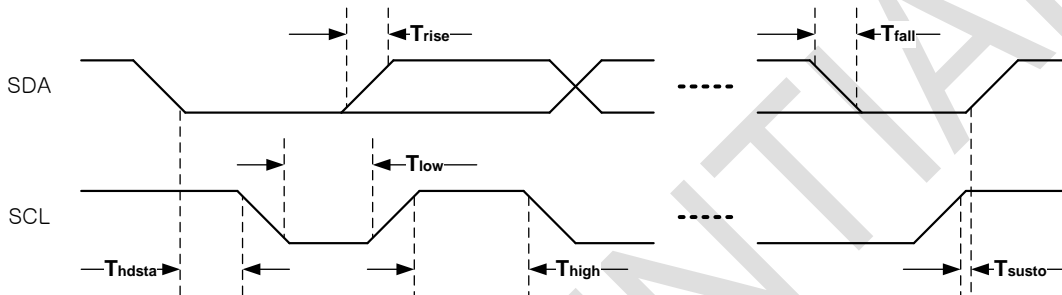

Figure 3. I²C Mode Timing

4.6. Switching Characteristics – Audio Interface

Parameters	Symbol	Min	Max	Unit
BCK high time	t _{bh}	20	-	ns
BCK low time	t _{bl}	20	-	ns
SDATA setup time before BCK rising edge	t _{ds}	10	-	ns
SDATA hold time after BCK rising edge	t _{dh}	10	-	ns
WCK setup time before BCK rising edge	t _{ws}	20	-	ns
BCK rising edge before WCK edge	t _{wh}	20	-	ns
BCK falling edge before WCK edge	t _{wl}	-20	20	ns
Rising/Falling time for BCK/WCK	t _{br} /t _{bf} /t _{wrf}	-	50	ns

※ Schmitt trigger characteristics (V_{SIH} Min = 1.85V, V_{SIH} Max = 0.9V)

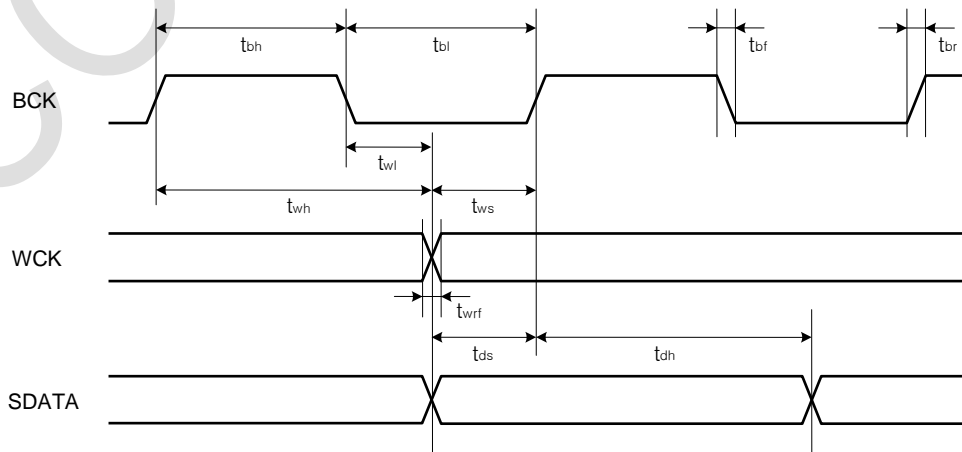

Figure 4. Audio Interface Timing

5. I2C BUS OF NTP8825

The NTP8825 uses an industry standard Inter IC Control (I2C) bus to communicate with host IC. A host IC can write or read internal registers of the NTP8825 via the I2C bus.

5.1. General Description of I²C Bus

The I²C bus uses two signal lines – a serial clock line (SCL) and a serial data line (SDA). Because the SDA line is open-drain type port, both the NTP8825 and a host IC can only drive these pins low or leave them open.

In I²C bus, a master device means the device which generates serial clock on the SCL. A slave device means the device which receives serial clock. There can be many master and slave devices on an I²C bus. But, when one master device works on the bus, the other master devices should not generate signal on the lines. These unexpected interrupts can make other slave devices to fail to communicate with the mater device.

The NTP8825 supports only slave mode of I²C bus. So, the NTP8825 always receives serial clock from a host IC. The slave mode is enough to write/read data to/from the NTP8825.

Figure 5. Basic Signaling Elements of I²C Bus

If there are no communication on I²C bus, lines must keep in high state. I²C bus begins communication with the start condition and ends communication with the stop condition. The start condition can be generated by changing the SDA state high to low, during the SCL state remains in high. The stop condition can be generated by changing the SDA state low to high during the SCL remains in high state. Be aware that the stop condition always reset the internal status of I²C bus control logic. Except these two conditions, the SDA may not change during the SCL in high state. Otherwise, abnormal start or stop condition will be generated.

I²C bus transfers the MSB of a byte on 1st data slot and the LSB of a byte on 8th data slot. I²C bus checks success or fail of transfer on every 1 byte transfer. The device which found an expected data on SDA must generate acknowledgement (keep low on SDA) on 9th clock. If there is no acknowledgement on 9th clock, the device which generated a data on SDA may stop transfer. The NTP8825 will generate acknowledgement for every successful data transfer of 1 byte in write mode. But, in read mode, because data is generated by the NTP8825, the NTP8825 will not generate an acknowledgement. In this case, on the contrary, the NTP8825 will check SDA state on 9th clock that the master device received a read data properly.

Because there can be many other slave device on the I²C bus, the master device sends a target slave address on the 1st byte. 7 bits from 1st to 7th bit of 1st byte are used for the slave address. The NTP8825 will response with slave address 0101010 or 0101011. If the AD pin was on low state in low to high transient of the RESET pin, the NTP8825 will use 0101010 for a slave address. Else if the AD pin was on high state in low to high transient of the RESET pin, the NTP8825 will use 0101011 for a slave address.

AD	I ² C Address
0	0x54
1	0x56

Table 2. I²C Address

Last 8th bit of the 1st byte is used to indicate whether the master device want to write or read data.

5.1.1. Writing Operation

When last 8th bit of the 1st byte is set to low state, the writing operation of bus begins. The NTP8825 supports 3 kind of writing operations which presented on **Figure 6**

The type presented on **Figure 6-(a)** is single byte write operation. “Sub address” on 2nd byte means the internal register address of the NTP8825. The “Data” on 3rd byte will be written into the internal register address on “Sub address”. If stop condition is not generated, writing “data” on specific “sub address” can be repeated like **Figure 6-(b)**. “Data #n” will be written on “sub address #n”.

The type presented on **Figure 6-(c)** is burst byte write operation under address auto increment mode. The AIF is the address Auto Increment Flag which is 1st bit of 2nd byte of I²C packet. On SDA, if AIF is set to high state, the NTP8825 starts auto incrementing the address with respect to given “sub address” and host send write data continuously over SDA. In AIF mode, access to the register addresses 0x3B~0x49, 0x4F and 0x5E are automatically skipped.

Figure 6. Single Byte Write Mode Sequence

Figure 7-(a), **Figure 7-(b)**, and **Figure 7-(c)** represent 4 byte writing operations. Coefficient Mode Register address 0x00~0x6B are used to configure Bi-Quad filter coefficients, Low Shelf BQ filter coefficients, Loudness gains and DRC clip down gain. The data size of these coefficients and gains is 4 byte for each. The difference between 4byte writing operation and single byte writing operation is only the size of transferring data. So, after sending “Sub address”, 4 sequential bytes must be transferred from the MSB(most significant byte) to the LSB(least significant byte) sequence.

The type presented on **Figure 7-(c)** is quad byte write operation under address auto increment mode, AIF function. Please compare the data transfer size between **Figure 6** and **Figure 7**.

Figure 7. Quad Byte Write Mode Sequence

In write operation, the register 0x7E value needs to be set first for performing the configuration of the registers belong to all channels. The 0x7E register also support to configuring byte writes operation and word i.e. 4 byte writes operation.

If 0x7E register is configure to 0x00, it support byte write operation and for word i.e. 4 byte write operation for each channel it needs to configure as 0x01 for channel 1, 0x02 for channel 2, 0x04 for channel 3 and 0x08 for PEQ coefficient. Also to configure channel1 and channel2 with the same values, the 0x7E register needs to configure as 0x03. So the same values get sets for both the channel with only one write operation.

The ROM BQ addresses from 0x00 to 0x3B and from 0x41 to 0x63 are used for the Bi-Quad filter coefficients in the coefficient mode. Each Bi-Quad filter uses 5 coefficients. Any unexpected coefficient value changes on any part of 5 coefficients can generate unstable Bi-Quad filter response. For example, if only one of 5 coefficients for a Bi-quad filter is changed and downloaded, its combined 5-coefficient set can have unstable operation while old and new coefficients are mixed together. Therefore to prevent this kind of problem, the NTP8825 writes coefficients to coefficient registers only when the last 5th coefficients of each Bi-Quad filter are downloaded, which means all of 5 coefficients are fully ready. Please refer to 9.1 for more detailed operation.

5.1.2. Reading Operation

Figure 8-(a) represents single byte reading operation from the NTP8825. To read data from the NTP8825, generate start condition to start transfer. After then, send “slave address” with write mode flag and send the register address(sub address). By regenerating start condition (Sr) again and transferring “slave address” with read mode flag, reading operation begins. The NTP8825 will generate data on SDA signal synchronizing with serial clocks on the SCL. Because the SDA signal generated from the NTP8825, the master device must generate ACK on 9th slot to confirm that the master received read 1 byte successfully. However, if this is just one byte reading operation, NAK (not acknowledged) signal must be generated. Then stop condition must be generated to end transfer.

When AIF set to high on sub address like **Figure 8-(b)**, data will be read continuously with register addresses which are increased from initial “sub address” for every byte. In continue reading operation, the master must generate ACK signal on every 9th bit of the packet to confirm that master has received 1 byte successfully. Otherwise, reading operation will be terminated.

At the end of AIF reading operation, the NAK should be generated on 9th bit of the last data read to stop the AIF continuous reading operation. Also in reading operation access to the register mention in the “Write Operation” are skipped.

Figure 8. Single Byte Read Mode Sequence

Figure 9 represents quad byte reading operation. The difference between quad byte reading operation and single byte reading operation is only the size of receiving data. So, after sending “Sub address”, 4 sequential bytes must be received from the MSB to the LSB sequence.

The type presented on **Figure 9-(b)** is quad byte read operation under address auto increment mode, AIF function. Please compare the data receive size between **Figure 8** and **Figure 9**.

Before reading operation, the value of register 0x7E should be set first. In case single byte reading operation, set the register 0x7E to “0000”. In case 4 byte reading operation, set the register 0x7E to “0001” for channel1, “0010” for channel2, “0100” for channel3, or “1000” for PEQ coefficient.

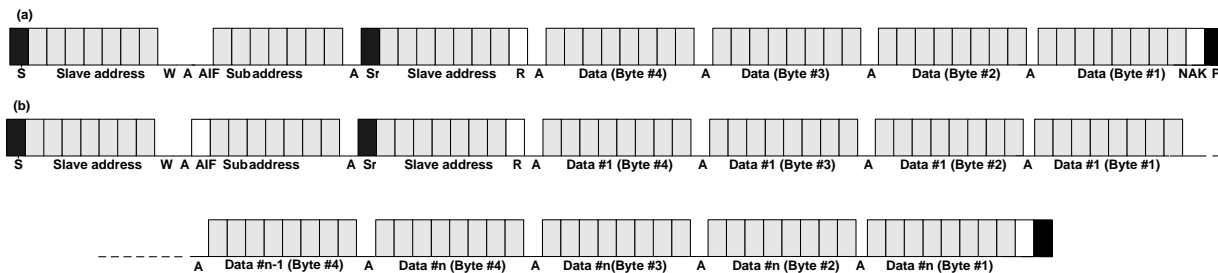

Figure 9. Quad Byte Read Mode Sequence

In read operation, the register 0x7E value needs to be set first for performing the configuration of the registers belong to all channels. The 0x7E register also support to configuring byte reads operation and word i.e. 4 byte reads operation.

If 0x7E register is configure to 0x00, it support byte read operation and for word i.e. 4 byte read operation for each channel it needs to configure as 0x01 for channel 1, 0x02 for channel 2, 0x04 for channel 3 and 0x08 for PEQ. Also to configure channel1 and channel2 with the same values, the 0x7E register needs to configure as 0x03. So the same values get sets for both the channel with only one read operation.

5.2 I²C Glitch Filter

To clean out the threats of noise in today's high-speed-board system, the NTP8825 has a glitch elimination filter on the I²C ports. Glitches in the transmission lines of the I²C port can be safely removed with this function. Please refer to the register 0x39.

6. CLOCK, RESET & CONTROL

6.1. System Clock

The internal system clock of the NTP8825 is generated from an external master clock by the on-chip PLL. The NTP8825 supports external master clock frequency from 2.048 MHz to 24.576MHz. For proper operation, the registers for the PLL should be set correctly according to master clock frequency (Address 0x02).

6.2. Timing Sequence

For proper power up, initialization and power down of NTP8825, it is recommend to use the following sequence as shown in **Figure 10**.

Figure 10. Recommended Timing Sequence

6.2.1. Power-Up & Initialization Sequence

- 1) Ramp up VDD_IO to at least 3.3V.
- 2) Ramp up PVDD.
- 3) After 0.5msec ($T1 \geq 0.5\text{msec}$), drive /RESET = High, and then wait for at least 1msec ($T2 \geq 1\text{msec}$).
- 4) Hold /RESET Low for at least 0.1μsec ($T3 \geq 0.1\mu\text{sec}$)
- 5) Drive /RESET = High, and then wait for at least 0.5msec for I²C communication ($T4 \geq 0.5\text{msec}$).
- 6) BCK signal should arrive at least 1msec before I²C initialization sequence ($T5 \geq 1\text{msec}$).
- 7) Execute both amp initialization sequence (e.g. clock, volume, DRC, PEQ setup) and Sound on sequence.

6.2.2. Power-Down Sequence

- 1) When both DC and AC power are off, make sure to execute sound off sequence.
- 2) Switch /RESET to Low after sound off sequence ($T6 \geq 0.5\text{msec}$).
- 3) BCK and I²C should be Low after sound off sequence ($T7 \geq 0.5\text{msec}$).
- 4) After I²C is Low, ramp down VDD_IO.

6.3. Sound On/Off Sequence

For proper sound on/off of NTP8825, use the following sequence as shown in **Figure 11**.

Figure 11. Sound On & Off Sequence

To prevent pop noise when enabling or disabling the amplifier, the following sequences are recommended.

6.3.1. 2-channel Sound On/Off Sequence

A. Sound On Sequence

To turn on the amplifier, first, enable the PWM mask, and then turn on the PWM switching. Finally, apply the soft mute for increasing the output. The register settings are 0x04@0x28, 0x00@0x27, and 0x00@0x26, respectively.

B. Sound Off Sequence

To turn off the amplifier, reverse the sequence of the sound on; that is to say, apply the soft mute for decreasing the output, turn off the PWM switching, and disable the PWM mask. The register settings are 0x07@0x26, 0x07@0x27, and 0x06@0x28, respectively.

6.3.2. 2.1-channel Sound On/Off Sequence

A. Sound On Sequence

Only difference from the 2-channel sound on sequence is that the PWM switching on of the channel 3 should be applied after the channel 1 and 2. Therefore, the sound on sequence for 2.1-channel is as follows: firstly, enable the PWM mask, and, secondly, turn on the PWM switching for channel 1 and 2. Thirdly, turn on the PWM switching for channel 3, and finally, apply the soft mute for increasing the output. The register settings are 0x04@0x28, 0x04@0x27, 0x00@0x27, and 0x00@0x26, respectively.

B. Sound Off Sequence

The sound off sequence is exactly the same as that in the 2-channel case.

7. AUDIO INPUT

7.1. I²S and Serial Audio Interface

NTP8825 receives audio data through digital audio interface. There are 2 different formats generally used in digital audio interface - the Inter-IC Sound (I²S) Interface and General Serial Audio Interface (GSA). These two interfaces have some common features.

These interfaces use 2 clock lines and 1 data line to transfer audio data. One of these clock lines is the WCK. A period of the WCK is same with sampling period of audio data. This property enables the clock receiving device to synchronize data word-wise transmitting or receiving timing with clock generating device. Another functional aspect of the WCK is indication of current channel. In I²S mode, low state of the WCK indicates 1st channel or left channel, and high state of the WCK means 2nd channel or right channel.

The other clock line is BCK. This clock line is used to synchronize bit-wise timing. The number of clock for one WCK period can be selected on BCKS(Bit Clock Size Select) of register address 0x01.

NTP8825 functions as a slave on the bus. In slave mode, NTP8825 receives WCK and BCK from external source. The data transfer is done via SDATA line. The data being synchronized with the BCK must be loaded on this line. NTP8825 reads data on the rising edge of the BCK. NTP8825 reads data from defined bit range of WCK period. The bit range is selected by the interface type.

The bit range for I²S is predefined. GSA interface can select a bit range with LRJ, MLF and BS of register address 0x01. Please refer to in **Figure 12**.

7.1.1. I²S Glitch Filter

To clean out the threats of noise in today's high-speed-board system, the NTP8825 has a glitch elimination filter on the I²S ports. Glitches in the transmission lines of the I²S port can be safely removed with this function. Please refer to the register 0x61.

7.2. SDATA Generator

The SDATA generator of NTP8825 sends out I2S out signal. In order for SDATA out process to function stably, the falling of BCK should either synchronize or occur ahead of falling or rising of WCK.

Refer to the register Address 0x5F in the **Appendix A** and refer to the **4.6. Switching Characteristics – Audio Interface**.

7.3. Asynchronous Sample Rate Conversion

NTP8825 provides ASRC(Asynchronous Sample Rate Conversion) for input data sample rate from 8kHz to 192kHz.

ASRC can give seamless data continuity when clock sources of input I²S and MCLK are different. Another benefit of ASRC is audio processing can be done without any change of register settings when there happens an alteration in the input sample rate.

If ASRC is to be used, the LSB of 0x56 register, i.e. BYPASS, should be set as '0'. The default setting of BYPASS in the 0x56 register is '1', which means ASRC is disabled and synchronous conversion is applied.

Figure 12. Serial Audio Interface Format

8. MIXER

Channel mixer can be used in lots of application needs like pseudo stereo and etc. User can mix input channels into each output channels with designated gains and polarity. Step size of mixer gain is variable according to the gain level as shown below.

Volume Range (dB)	Step (dB)
+18 ~ +6	1
+5.5 ~ -5.5	0.5
-6 ~ -32	1
≤ 32	-∞

Table 3. Variable Step Mixing Gain

In total, 6 mixing gain coefficients denoted as M[0x03], M[0x04], M[0x05], ... M[0x08] are defined as shown in the equation below. Each Mxx stores volume value in dB scale, and the number values versus gain in dB are shown in the **Appendix C**. There are some places in the mixing matrix that are considered as trivial connections and thus predefined as -∞ dB.

$$[\text{Output Channels}] = [\text{Mixer Matrix}] \times [\text{Input Channels}]$$

$$\begin{bmatrix} \text{CH1 OUT} \\ \text{CH2 OUT} \\ \text{CH3 OUT} \end{bmatrix} = \begin{bmatrix} \text{M}[0x03] & \text{M}[0x04] \\ \text{M}[0x05] & \text{M}[0x06] \\ \text{M}[0x07] & \text{M}[0x08] \end{bmatrix} \cdot \begin{bmatrix} \text{CH1 IN} \\ \text{CH2 IN} \end{bmatrix}$$

Figure 13. Mixer Matrix

In order to load mixer coefficients into internal memory, send the index value in the gain value table to the register address 0x03~ 0x08.

9. PRE-PROCESSING

9.1. Pre Bi-Quad Filter Chain

NTP8825 has two kinds of Bi-Quad filter chains. One is Pre Bi-Quad filter chain and the other is Post Bi-Quad filter chain for bass management, loudness control, loud-speaker EQ, etc.

The former is called pre Bi-Quad filter chain and two 2nd order floating point Bi-Quad filters are connected serially to all the three channels. The structure is shown in **Figure 14**.

Figure 14. Pre Bi-Quad Filter Structure

Filter coefficients are 32-bit floating point numbers and can be downloaded thru I²C interface. To download the pre Bi-Quad filter coefficients to internal memory of NTP8825, designer should change the flags of register Address 0x7E to 'enable coefficient write' status.

When CH1(or CH2 or CH3) Flag of register Address 0x7E is set to 1, coefficient mode register address 0x00~0x04 designates coefficients of 1st pre Bi-Quad filter chain of channel 1(or channel 2 or channel 3) and indicates b₀, b₁, b₂, a₁, a₂ respectively. coefficient mode register address 0x05~0x09 designates the coefficients of 2nd chain of channel 1(channel 2 or channel 3).

The Bi-Quad filter structure is shown in **Figure 15**.

Figure 15. Bi-Quad Filter Structure

9.2. 3D Surround

3D surround expands the sound field of two channel stereo to the extent that is wider than the actual speaker spacing. Because this feature is acoustically valid for two channel signal, no other channels except channel 1/2 have this internal block.

NTP8825 realizes the 3D effect by combining delay and band-pass filter. At first, define the size of delay by using register Address 0x0D. Possible maximum delay is 40 samples delay and this is about 0.4msec based on 96kHz signal input.

And then download the band-pass filter coefficients to internal memory of NTP8825 (same with the Bi-Quad filter coefficient download procedure). The BPF is two 2nd order IIR filter. Each channel can have different BPF. Change the 3D flag status of register Address 0x7E to 'enable coefficient write' status and write the actual coefficient values to ten register Addresses 0x0A~ 0x13. Also, internal 2x2

mixer helps ease of design. For using 3D mixer, download the gain values to two coefficient mode register addresses 0x3C~0x3D.

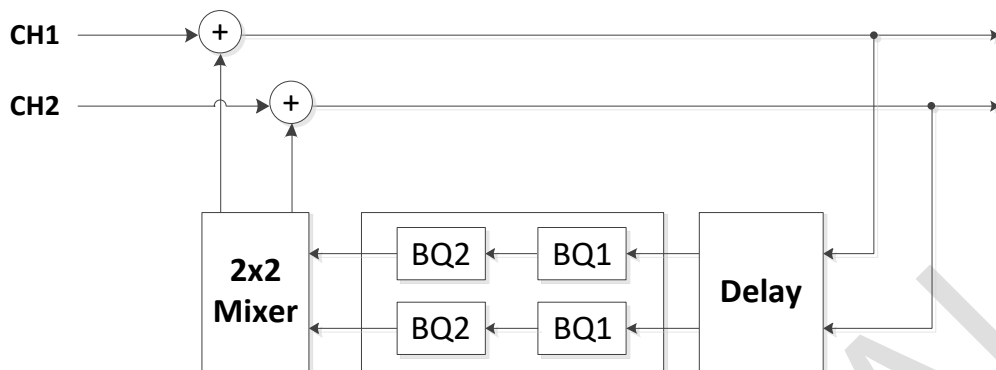

Figure 16. 3D Surround Structure

9.3. Configurable Graphic Equalizer

NTP8825 provides 5 band graphic equalizer and PEQ to 1/2 channel. EQ on/off can be selected by EQ flag of register Address 0x0F.

The gains for each band can be controlled by writing the gain values (refer Graphic equalizer band gain table in **Appendix C**) to register Addresses 0x10~14 respectively.

In PEQ the BQ1 ~ BQ5 can be used as programmable Bi-Quad filters.

Figure 17. Configurable Graphic Equalizer

9.4. Post Bi-Quad Filter Chain

The post Bi-Quad filter chains of NTP8825 can be used in various purposes - bass management, loudness control, parametric EQ, loud-speaker EQ, etc. Independent filter design for 1, 2 channels are possible and five 2nd order floating point parametric filters are linked serially. Especially for loudness control, as shown in **Figure 18**, last 3 filters are different from first 2 filters.

Filter coefficients are 32-bit floating point numbers and can be downloaded thru I²C interface. To download post Bi-Quad filter coefficients to NTP8825, select download channel by using CH flag in register Address 0x7E first. And then write actual coefficient values, from 0x14 to 0x3B for Ch1&2 Control, from 0x0A to 0x18 for Ch3 control in the coefficient mode register address.

coefficient mode register address 0x14~0x18 designates 1st chain coefficients and means b0, b1, b2, a1, a2 in sequence. Address 0x19~0x1D designates 2nd chain, and so on. The enable/disable operation of these Bi-Quads can be made by using BQF flag in register Addresses 0x17~0x1B(include Ch3 control).

(refer register Address table in **Appendix A** and refer coefficient mode register address table in **Appendix B**)

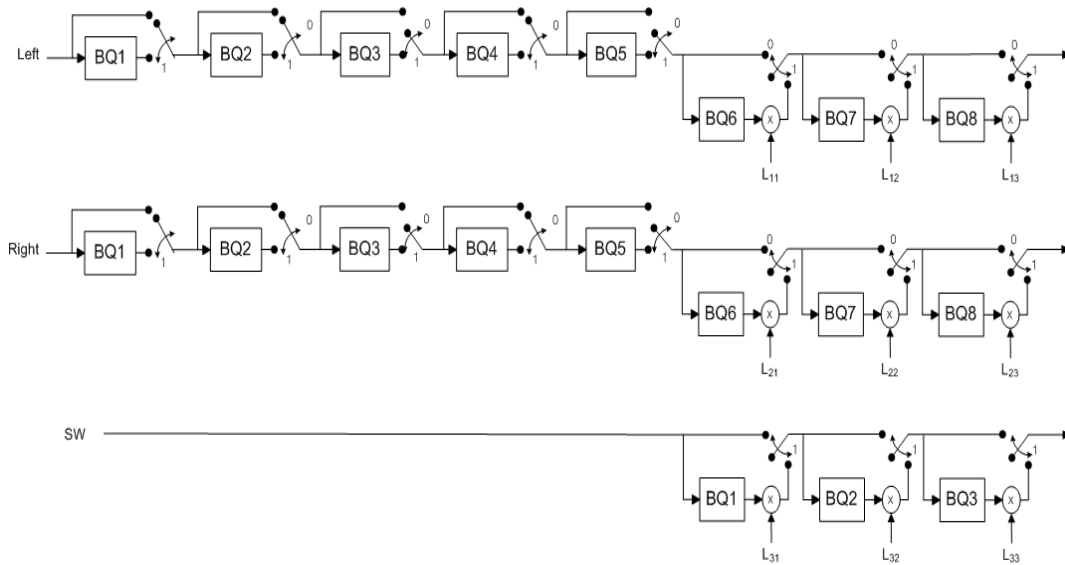

Figure 18. Post Bi-Quad Filter Structure

9.5. Loudness Control

NTP8825 provides loudness control function using post Bi-Quad filter chains. Loudness control means the compensation of frequency characteristics in low volume level to fit the acoustic characteristics of human ears

There are 3 Bi-Quad filters for loudness gain per each channel. To download a loudness gain of each Bi-Quad, the page flag register 0x7E should be set as same in the case of downloading the filter coefficients. The loudness gain values are applied for both channel 1 and 2 and when downloading the loudness gain values, a user should set the register 0x7E as 0x03.

loudness gains of CH1/CH2	Coefficient mode register Address		
	0x3E	0x3F	0x40
register Address 0x7E= 0x03 case	L1	L2	L3

loudness gains of CH3	Coefficient mode register Address		
	0x1E	0x1F	0x20
register Address 0x7E= 0x04 case	L1	L2	L3

Table 4. Address for Loudness Gain

10. VOLUME & DYNAMIC RANGE CONTROL

Master and channel volumes of the NTP8825 are independently controlled and softly changed. The system register address 0x2E is the master volume control that affects 3 channels simultaneously and the address 0x2F, 0x30 and 0x31 correspond to the channel volume control register for channel 1, 2 and 3 respectively.

The possible Maximum Gain is +48.375dB with using master volume fine control, master volume and channel volume because the master volume applies the gain to an input signal independent from a channel volume. However, in such a case, a clipping might occur to prevent a signal overflow error if the magnitude of the input signal is large enough to exceed 0dB under the combined volume setting.

10.1. Master Volume Control

By setting volume control register (address 0x2E), master volume is controlled from negative infinity through 24dB with selectable step size as follows. For details on the master volume setting, see the register value table shown in **Appendix C**.

Step	Range
0.5 dB	+24 ~ -100 dB
10 dB	-100 ~ -150 dB

Table 5. Level Dependent Master Volume Steps

10.2. Channel Volume Control

By setting volume control registers (address 0x2F~0x31), channel volumes are independently controlled from negative infinity through +24dB with two selectable step sizes as described below, and in the **Appendix C**, exact values for channel volume setting are described.

Step	Range
0.5 dB	+24 ~ -100 dB
10 dB	-100 ~ -150 dB

Table 6. Level Dependent Channel Volume Steps

10.3. Master Volume Fine Control

Fine control for master volume is possible (+0.0625dB step up to maximum +0.4375dB boost). Refer the system register Address 0x2D in the **Appendix A**.

10.4. Mute and Soft Volume Change

The NTP8825 enters mute state by setting soft mute flag of register Address 0x26. Soft mute is implemented so that the volume gradually increases or decreases when mute is turned off or on respectively. Also the soft mute speed and soft volume change speed rates are programmable. Designers can minimize the pop noise by controlling the soft mute speed and volume change intervals. Refer SMH flag of register Address 0x26 and SVI flag of register Address 0x32.

10.5. Auto Mute

The NTP8825 can mute the sound automatically when the level of input audio signal is lower than the register-controlled threshold value. The mute can be done PWM switching with 50 % duty ratio. Auto mute is supported for internal channels 1~3 after 2x3 mixer block. Refer register Address 0x33 and 0x34.

10.6. Dynamic Range Control

Dynamic range control can be turned on or off with programmable compression threshold and attack/release rates. The threshold parameters of DRC can be controlled separately for channel 1/2 and channel 3. For detailed setting, please refer to the system register Addresses 0x1C~0x25 and refer to the coefficient mode register addresses in Table 7.

Figure 19. Block Diagram of Dynamic Range Control

2B' DRC Coefficient Mode Register Address	0x46 ~ 0x4A	0x4B ~ 0x4F	0x50 ~ 0x54	0x55 ~ 0x59	0x5A ~ 0x5E	0x5F ~ 0x63

Table 7. DRC Coefficient Mode Register Map for Dynamic Range Control

11. OUTPUT INTERFACE

11.1. Output Configuration

The output mode of NTP8825 is 2.0 stereo reproduction mode and 2.1 reproduction mode. To produce proper output signal, register 0x35~0x37 should be set to appropriate values.

11.2. AM Interference Relief Mode

The NTP8825 has AM interference reduction mode. In this mode SNR performance of NTP8825 can be degrade down to 90 dB and the PWM switching frequency is spread from 384kHz through 768kHz.

11.3. PWM Output Mapper

Any internal channel that produces a PWM output can be assigned to any PWM output hardware port (or pin) by mapping output port register. This feature is very helpful for the hardware designer because it can relieve difficulties in the power stage signal routing and channel assignment if the output channel order is fixed. See the system register address 0x35~0x37 in the **Appendix A**.

11.4. Switching Output Mode

There are two selectable switching output modes in NTP8825. The difference between two output modes lies in the relationship of the relative signal pattern between PWM OUTxA and PWM OUTxB for a channel x. The first one is called as AD mode. This AD mode can be applied to both half bridge and full bridge output stage.

Figure 20. PWM Output Signals in AD Mode

AD asynchronous pair means the normal AD mode PWM output. In other words, A output and B output of each PWM output pair are mutually complementary. In the case of AD synchronous pair, A output and B output is perfectly identical, and its relation is not complementary. This is useful in some special case including single-ended power stage design.

The other one is called as NTX (Neo Trinity Amplification), which is D-BTL mode. This mode is applied only for BTL, and its operation is dynamically-biased BTL, compared to the normal BTL. An example of output signals in D-BTL mode is shown in **Figure 21**.

Figure 21. PWM Output Signals in D-BTL Mode

For D-BTL mode, there are two additional parameters, which is MLP (Minimum Linear Pulse Length). MLP defines the minimum pulse length that can guarantee a linear relationship between the input and output pulse length. Generally, the width of the output pulse is proportional to that of the input pulse. However, as the width of input pulse becomes narrower, such linear relation is not maintained due to the characteristic of a power device. The minimum MLP value is preferred as long as linear relationship between the input and the output pulse is satisfied. In addition, in terms of power consumption, a minimal MLP value is preferred. This compensation is illustrated in **Figure 22**.

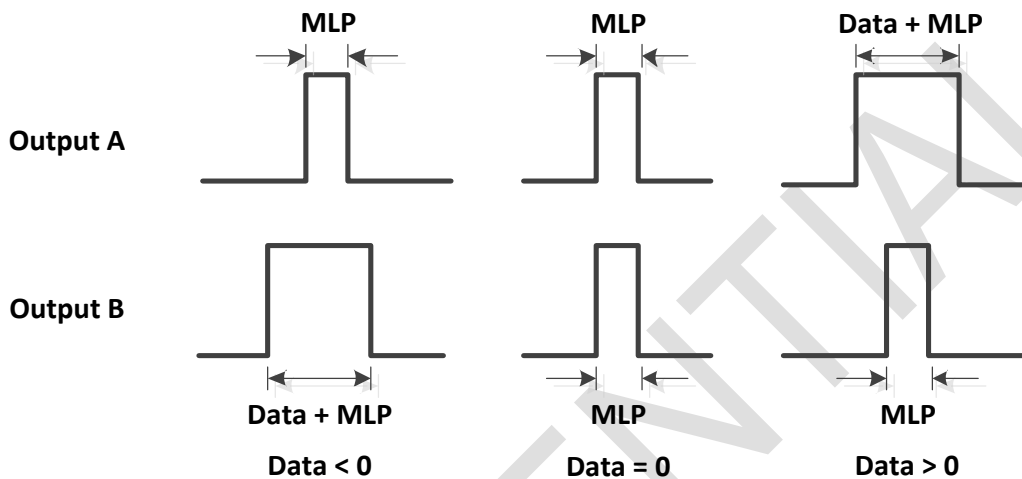

Figure 22. Compensation by MLP

11.5. Soft Start

The soft_start reduces pop noise by controlling rapidly increased energy of PWM. To begin soft_start operation, PWM soft start enable register (0x52: PSE) should be set to high, and then PWM switching on/off register (0x27: POF) should be set to low. The duty ratio of PWM output increases from 127:1 (Low:High) to 50:50 (Low:High). Step repeat time register (0x52: SRT) means repeat number of PWM output. Soft_start operation with 17 repetitions is shown in the **Figure 23**.

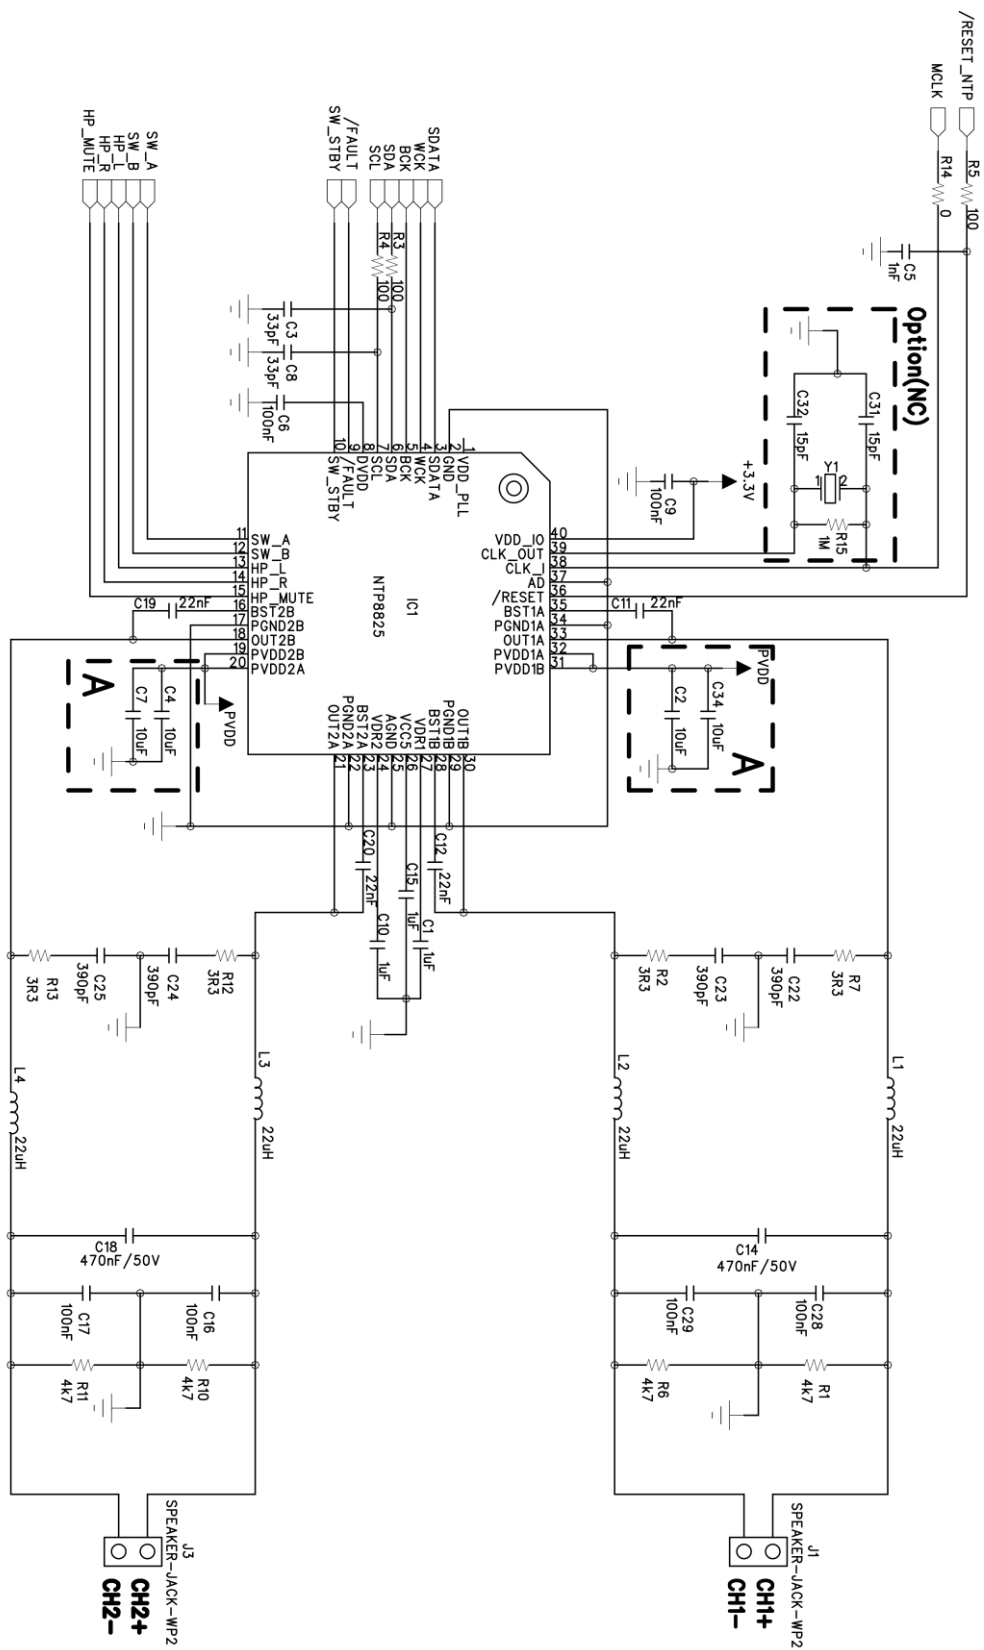

Figure 23. Soft Start Operation Timing

Addr 0x24 : DRC Control 8

Bit	7	6	5	4	3	2	1	0
Name	X	X	X	DLL				

Name	Description	Value	Meaning	Ref.
DLL	Delay line length	h'00 ~ h'14	Delay line length. 0~20(decimal)	

Addr 0x25 : DRC Control 9

Bit	7	6	5	4	3	2	1	0
Name	CCO	DTS1	DTS2	2BM	ASB	RSB	TSB	CAS

Name	Description	Value	Meaning	Ref.
CAS	Coupled Allpass Structure enable	b'0	Enable coupled allpass structure	
		b'1	Disable coupled allpass structure	
TSB	Threshold parameter select bit	b'0	Uses Threshold parameters in Table	
		b'1	Uses Threshold parameters from external loading	
RSB	Release parameter select bit	b'0	Uses Release parameters in Table	
		b'1	Uses Release parameters from external loading	
ASB	Attack parameter select bit	b'0	Uses Attack parameters in Table	
		b'1	Uses Attack parameters from external loading	
2BM	2band mode enable	b'0	1 band DRC	
		b'1	2 band DRC	
DTS2	P-DRC type select	b'0	P-DRC new mode	
		b'1	P-DRC old mode	
DTS1	LH-DRC type select	b'0	LH-DRC new mode	
		b'1	LH-DRC old mode	
CCO	Clip control option	b'0	Clip on	
		b'1	Clip off	

※ case. 1band DRC : CAS must be enabled.

Addr 0x26 : Soft Mute Control 0

Bit	7	6	5	4	3	2	1	0
Name	SMH	X	X	X	X	SM3	SM2	SM1

Name	Description	Value	Meaning	Ref.
SMn	Softmute	b'0	increase for channel n	
		b'1	decrease for channel n	
SMH	Softmute speed	b'0	42/46 msec(at 96/88.2kHz))	
		b'1	Hard change	

Addr 0x27 : PWM Switching On/Off Control

Bit	7	6	5	4	3	2	1	0
Name	X	X	X	X	X	POF3	POF2	POF1

Name	Description	Value	Meaning	Ref.
POFn	Switching output On/off control	b'0	Channel n PWM switching on	
		b'1	Channel n PWM switching off	

Addr 0x28 : PWM_MASK Control 0

Bit	7	6	5	4	3	2	1	0
Name	X	X	X	X	SRD	FPMLD	PWMM	

Name	Description	Value	Meaning	Ref.
PWMM	PWM MASK register	b'10	PWM MASK output is low. (reset default)	
		otherwise	PWM MASK output is high.	
FPMLD	Permanent PWM_MASK Low disable flag	b'0	No effect	
		b'1	Reset the auto_PWM_MASK_restore_counter to 0	
SRD	FAULT disable	b'0	FAULT is effect for PROTECT	
		b'1	FAULT is ineffective for PROTECT	

Addr 0x29: PWM_MASK Control 1

Bit	7	6	5	4	3	2	1	0
Name	X	X	X	X	X	X	APM	POF

Name	Description	Value	Meaning	Ref.
POF	PWM off flag	b'0	Even if Auto PWM_MASK condition is met, the PWM output of all channel is not affected.	
		b'1	When Auto PWM_MASK condition is met, the PWM output of all channel goes to the defined state which is set by the PWM off state control register (Addr 0x2A).	
APM	PWM_MASK flag	b'0	Even if Auto PWM_MASK condition is met, the PWM_MASK output of all channel is not affected.	
		b'1	When Auto PWM_MASK condition is met, the PWM_MASK output goes to Low state.	

Addr 0x2A : PWM_MASK Control 2

Bit	7	6	5	4	3	2	1	0
Name	VMSK3	VMSK2	VMSK1	VMSK0	PMSK3	PMSK2	PMSK1	PMSK0

Name	Description	Value	Meaning	Ref.
PMSK	Masking bit of PWM off control	b'0	Mask bit indicating the validity of n-th bit of Addr 0x5E system register: If the n-th bit of this register is zero, the n-th bit of Addr 0x5E system register is invalid. The n-th bit of Addr 0x5E is valid only when the n-th mask bit is one.	
		b'1		
VMSK	Masking bit of PWM_MASK signal	b'0		
		b'1		

Addr 0x2B : PWM_MASK Control 3

Bit	7	6	5	4	3	2	1	0
Name	IRC		AVRCT			PHT		

Name	Description	Value	Meaning	Ref.
PHT	PWM_MASK Low Hold Time	b'000	0.5 msec Hold Time	
		b'001	1 msec Hold Time	
		b'010	2 msec Hold Time	
		b'011	4 msec Hold Time (Default)	
		b'100	8 msec Hold Time	
		b'101	16msec Hold Time	
AVRCT	Auto PWM_MASK Restore Counter Threshold	b'000	2	
		b'001	5 (Default)	
		b'010	10	
		b'011	15	
		b'100	20	
		b'101	25	
		b'110	30	
IRC	Auto PWM_MASK Restore Interval Ratio Control	b'00	2 (Default)	
		b'01	4	

Addr 0x2C: PWM_MASK Control 4

Bit	7	6	5	4	3	2	1	0
Name	SHE	POE	X	X	X	HT2		

Name	Description	Value	Meaning	Ref.
HT2	Hold Time 2 apply start point (restore counter)	b'000	100 msec Hold Time	
		b'001	200 msec Hold Time	
		b'010	400 msec Hold Time	
		b'011	600 msec Hold Time (Default)	
		b'100	800 msec Hold Time	
		b'101	1 sec Hold Time	
		b'110	2 sec Hold Time	
POE	PWM off when Fault detected and PWM on when PWM_MASK Recover	b'0	Disable	
		b'1	Enable (Default)	
SHE	Second Hold time Enable	b'0	Disable (Default)	
		b'1	Enable	

Addr 0x2D: Master Volume Fine Control

Bit	7	6	5	4	3	2	1	0
Name	X	X	X	X	X	MVFC		

Name	Description	Value	Meaning	Ref.
MVFC	Master volume fine control	h'0 ~ h'7	0 dB ~ 0.5 dB with 0.0625 dB step	

Addr 0x2E~0x31: Master Volume, and Ch1/2/3 volume, respectively

Bit	7	6	5	4	3	2	1	0
Name	VOL							

Name	Description	Value	Meaning	Ref.
VOL	Volume control	h'00 ~ h'FF	See volume control register tables. Reset default is 0 (0x00) (= -∞ dB)for Master and 207 (0xCF) for Channel	

Addr 0x32: Soft Volume Control

Bit	7	6	5	4	3	2	1	0
Name	X	X	X	X	X	X	SVI	

Name	Description	Value	Meaning	Ref.
SVI	Soft volume change	b'00	Medium speed	
		b'01	High speed	
		b'10	Low speed	
		b'11	soft volume change disable	

Addr 0x33: Auto-Mute Control for CH1 & CH2

Bit	7	6	5	4	3	2	1	0
Name	X	EAMC	II		AT			

Name	Description	Value	Meaning	Ref.
AT	Auto-mute detection threshold	b'0000 ~ b'1111	Unsigned integer between 0 and 15	
II	Auto-mute response time	b'00	5 msec	
		b'01	50 msec	
		b'10	500 msec	
		b'11	2 sec	
EAMC	Effect of Auto-mute condition	b'0	Auto mute disable(No-Effect)	
		b'1	Continue switching if auto-mute	

Addr 0x34: Auto-Mute Control for CH3

Bit	7	6	5	4	3	2	1	0
Name	X	EAMC	II		AT			

Name	Description	Value	Meaning	Ref.
AT	Auto-mute detection threshold	b'0000 ~ b'1111	Unsigned integer between 0 and 15	
II	Auto-mute response time	b'00	5 msec	
		b'01	50 msec	
		b'10	500 msec	
		b'11	2 sec	
EAMC	Effect of Auto-mute condition	b'0	Auto mute disable(No-Effect)	
		b'1	Continue switching if auto-mute	

Reserved Addr 0x35~0x37

Addr 0x38: Miscellaneous PWM Control

Bit	7	6	5	4	3	2	1	0
Name	X	X	X	POL	BHL	AHL	MD	

Name	Description	Value	Meaning	Ref.
MD	PWM output mode	b'00	AD mode with asynchronous signal pair	
		b'01	AD mode with synchronous signal pair	
		b'10	PWM D-BTL MODE (see 0x4E)	
		b'11	AM Interference mode	
AHL	A-out state When switching off	b'0	Low	
		b'1	High	
BHL	B-out state when switching off	b'0	Low	
		b'1	High	
POL	Ch3 polarity Control	b'0	Normal	
		b'1	Inverse	

Addr 0x39: I²C Glitch filter

Bit	7	6	5	4	3	2	1	0
Name	GFO	DUR						

Name	Description	Value	Meaning	Ref.
DUR	glitch width	b'000 0000 ~ b'111 1111	minimum pulse width = DUR + 20 ns reset default = 15 * 10 ns (DUR default = b'0001111)	
GFO	Glitch filter enable/disable	b'0	Glitch filter on	
		b'1	Bypass	

Addr 0x3A : Headphone Mute Control

Bit	7	6	5	4	3	2	1	0
Name	X	X	X	X	X	X	X	HP_MUTE

Name	Description	Value	Meaning	Ref.
HP_MUTE	Use this register to mute external headphone	b'0	Default. External headphone is muted by active low signal	
		b'1	External headphone is muted by active high signal.	

Reserved Addr 0x3B~0x49

Addr 0x4A : SE Soft Start Control 0

Bit	7	6	5	4	3	2	1	0
Name	X	X	X	X	X	X	X	SSE

Name	Description	Value	Meaning	Ref.
SSE	SE_STE	b'0	SE Soft Start Disable (SE Normal Start)	
		b'1	SE Soft Start Enable	

Addr 0x4B : SE Soft Start Control 1

Bit	7	6	5	4	3	2	1	0
Name	X	SSC						

Name	Description	Value	Meaning	Ref.
SSC	SE_CHARGE_TIME	h'00 ~ h'7F	PWM output delay time from point of PWM STBY signal to high. The unit of 1bit is 10ns. (default : 0x22)	

Addr 0x4C : SE Soft Start Control 2

Bit	7	6	5	4	3	2	1	0
Name	SSR							

Name	Description	Value	Meaning	Ref.
SSR	SE_REAPEAT	h'01 ~ h'FF	The repeat time of se soft start (default: 1 – means repeat 1 times)	

Addr 0x4D : SE Soft Start Control 3

Bit	7	6	5	4	3	2	1	0
Name	SPD							

Name	Description	Value	Meaning	Ref.
SPD	SE_PERIOD	h'01 ~ h'7E	Half period of PWM output start point. The unit of 1bit is 10ns. (default : 0x01 – means half period 20ns)	

Addr 0x4E : PWM D-BTL MODE Control 0

Bit	7	6	5	4	3	2	1	0
Name	X	MLP						

Name	Description	Value	Meaning	Ref.
MLP	Minimum Linear pulse length	h'08	Range : Minimum Pulse Width ~ 640ns, 20ns step.(refer Addr 0x45 for Minimum Pulse Width)	

Reserved Addr 0x4F

Addr 0x50 : PWM D-BTL Mode Control 1

Bit	7	6	5	4	3	2	1	0	
Name	X							NSS	

Name	Description	Value	Meaning	Ref.
NSS	NS Select	b'00	7bits NS (AD mode)	
		b'01	Reserved	
		b'10	8bits NS	
		b'11	New 8bits NS (D-BTL mode)	

Reserved Addr 0x51

Addr 0x52 : PWM Soft Start

Bit	7	6	5	4	3	2	1	0
Name	PSE	SRT						

Name	Description	Value	Meaning	Ref.
SRT	Step Repeat Time	b'000 0000 ~ b'111 1111	The repeat time of each step (default : b'0010000 – means repeat 17 times)	
PSE	BTL PWM soft start Enable	b'0	Disable	In Single Ended Mode, should be disabled
		b'1	Enable (Default)	

Addr 0x53: Power Meter Control

Bit	7	6	5	4	3	2	1	0
Name	X	X	X	PDPOS	X	X	PDCH	

Name	Description	Value	Meaning	Ref.
PDCH	Power meter Detect Channel	b'00	L+R (default)	
		b'01	L channel	
		b'10	R channel	
		b'11	reserved	
PDPOS	Power meter Detect Position	b'0	After volume (default)	
		b'1	Before volume	

Addr 0x54: Power Meter (read-only)

Bit	7	6	5	4	3	2	1	0
Name	0	0	0	0	0	0	0	0

Addr 0x55: Modulation Index & NS-Type Control

Bit	7	6	5	4	3	2	1	0
Name	X	M0		NT	MD3		MD12	

Name	Description	Value	Meaning	Ref.
MD12	Modulation index control by Minimum pulse width for Ch 1&2	b'00	Minimum pulse width = 80ns	
		b'01	Minimum pulse width = 60ns	
		b'10	Minimum pulse width = 40ns	
		b'11	Minimum pulse width = 20ns	
MD3	Modulation index control by Minimum pulse width for Ch 3	b'00	Minimum pulse width = 80ns	
		b'01	Minimum pulse width = 60ns	
		b'10	Minimum pulse width = 40ns	
		b'11	Minimum pulse width = 20ns	
NT	Noise shaping Type for Ch 1&2	b'0	Type 1 (fourth order)	
		b'1	Type 2 (fifth order)	
M0	Dither Position Selector	b'00	No left shift on dither value = Dither off	
		b'01	1bit left shift on dither value	
		b'10	2bit left shift on dither value	
		b'11	3bit left shift on dither value	

Addr 0x56: ASRC Control 0

Bit	7	6	5	4	3	2	1	0
Name	X	X	DCESW	X	FSFHM	FSFSM	X	BYPASS

Name	Description	Value	Meaning	Ref.
BYPASS	Bypass	b'0	Normal operation	
		b'1	Bypass	
FSFSM	frequency stable effect on soft mute flag	b'0	no effect on soft mute flag	
		b'1	soft mute flag = 1 when unstable state	
FSFHM	frequency stable effect on hard mute flag	b'0	no effect on hard mute flag	
		b'1	hard mute flag = 1 when unstable state	
DCESW	DC Check Enable of SRC WCK	b'0	DC Check Disable in SRC WCK	
		b'1	DC Check Enable in SRC WCK	

Reserved Addr 0x57~0x5D

Addr 0x5E: System Error Status (read-only)

Bit	7	6	5	4	3	2	1	0
Name	FSI				MPW	LSRC	ULCK	PPM

Name	Description	Value	Meaning	Ref.
PPM	Permanent PWM_MASK Indication flag	b'0		
		b'1	Indicated that PWM_MASK is in Permanent LOW state	
ULCK	Sampled PLL Unlock error	b'0	PLL is locked state.	
		b'1	PLL is unlocked state.	
LSRC	SRC lock status	b'0	SRC is unlocked state.	
		b'1	SRC is locked state	
MPW	MCK/WCK Ratio error	b'0	Ratio is incorrect.	
		b'1	Ratio is correct.	
FSI	Sampling Frequency Information	b'0000	8 kHz	
		b'0001	11.025 KHz	
		b'0010	12 kHz	
		b'0011	16 kHz
